ADDENDUM A · CONTINUES THE LIA TECHNICAL PROPOSAL (FINAL V1.0)

Hybrid hosting for Lebawi International Academy: sensitive records on the school server, other work on the MaJo-Bridge cloud

Prepared for Lebawi International Academy (LIA) · Continues
MaJo_Bridge_LIA_Technical_Proposal FINAL

PARENT DOCUMENT

MaJo Bridge e-School OS Technical Proposal for Lebawi International Academy · Version 1.0 FINAL (12–14 September 2026). That paper mapped the TOR to 55+ live desks.

This paper does not replace it.

THIS DOCUMENT

Addendum A · Hybrid hosting and company experience · 15 September 2026 · Version 1.0-A

PREPARED FOR

Lebawi International Academy
Academic leadership, DoES / DoMS / DoHS,
DoSA, QA, IT, and the Board

What this addendum answers. LIA asked that school-sensitive student data live on a server the Academy controls, while the rest of the system may use the MaJo-Bridge cloud. That is a **hybrid architecture**: two machines, one school, one login. The parent proposal still stands for modules, roles, TOR mapping, training, and go-live. This paper states, in school language, what sits in the LIA server room, what sits in the cloud, how the two talk, and why MaJo-Bridge can deliver it.

1. How to read this addendum

Read this after the FINAL technical proposal. Keep that document for the 55+ desks and the TOR map. Use this document for hosting.

1. **Hybrid hosting** — sensitive records on the LIA school server; other data and services on the MaJo-Bridge cloud.
2. **Experience** — the same company already delivers school and non-school systems: Fenote Raey Academy, GYMOS, Post Printing Company ERP, Tena, websites, and ongoing projects.

Commercial price is not in this paper. Terms stay with the parent proposal and any later commercial agreement. After a live-site update, hard-refresh with **Ctrl+Shift+R**.

Contents

1. How to read this addendum
2. Why LIA asked for hybrid hosting
3. The hybrid picture in one page
4. What stays on the LIA school server
5. What stays on the MaJo-Bridge cloud
6. How the two servers work together
7. Security, backups, and who holds the keys
8. What LIA provides and what MaJo-Bridge provides
9. How we implement hybrid for LIA
10. Company experience that continues from the parent proposal
11. Closing and signatures

2. Why LIA asked for hybrid hosting

The parent proposal (Section 10) already said: the school remains the owner of its student data; another school cannot open LIA records; snapshots do not copy passwords. LIA has now made the hosting rule sharper:

Records that can identify a child, a medical fact, a mark, or a protection case must sit on a server in the Academy — not as the master copy in a public cloud. Everything else — the app people download, the live bus map, notices the school chooses to publish, system updates — may live on the MaJo-Bridge cloud so phones and home internet still work.

That is a normal request for an international school. It is not a second product. It is a **placement** of the same desks the FINAL proposal already listed.

Plain sentence for the Board. The markbook, the safeguarding file, and the child's date of birth live in LIA's server room. The parent still opens the same app. The cloud carries the road to that app; it does not become the school's filing cabinet.

3. The hybrid picture in one page

Think of two rooms connected by a locked corridor.

LIA school server (on campus)

A computer (or small server pair) that LIA owns, in a locked room LIA controls. This is the **vault**.

- Source of truth for student identity, marks, health, safeguarding, discipline, and counseling.
- Teachers on campus can keep working if the internet to the outside world is slow.
- LIA IT can see the machine, the power, and the Friday snapshot.

Majo-Bridge cloud server

The hosted platform the Academy already inspected at <https://mayabela.pages.dev>. This is the **road and the workshop**.

- App updates, login routing by School ID, support tools.
- Services that need the public internet (live bus GPS, parent phones off campus).
- Only the data LIA has allowed to leave the vault — never a second master of marks or safeguarding.

One login, two rooms. A teacher, parent, or director still signs in with School ID + phone/username + password. The product then asks one question: “Is this a sensitive LIA record?” If yes, it reads and writes the school server. If no, it uses the cloud. Nobody is asked to keep two systems or two student ids.

Everyday action	Where the master record lives	What the cloud does
Create or edit a student	LIA school server (SIS)	Routes the signed-in person; does not keep a second SIS master
Enter or approve a mark	LIA school server (markbook)	Delivers the app; may show a parent only what the school has published
Open a safeguarding case	LIA school server only	Nothing. The cloud does not store the case file
Send a school announcement	LIA chooses: school server, or a cloud copy LIA approved	Helps phones receive the notice
See the bus on a map	Live point is short-lived	Map tiles and the live share while the driver is sharing
Install or update the Android app	—	Cloud delivers the installer and updates
Admin CCTV	School NVR / cameras already on campus	The desk in the sidebar; footage stays on LIA hardware

4. What stays on the LIA school server

“Sensitive” here means: a record that names a child or a family, a medical or protection fact, a mark, or a staff file LIA treats as internal. These collections have their **master copy on the Academy server**. The cloud is not allowed to become a second filing cabinet for them.

4.1 Student identity and family (SIS)

- Legal name, preferred name, student id, date of birth, sex, house, class, campus.
- Parent and guardian names, phones, emails, and the approved parent-link.

- Medical flag and the health record the nurse or counselor keeps.
- Admissions file until the child is enrolled; alumni file after they leave.

4.2 Academic record

- Weighted markbook: homework, quiz, midterm, exam — the numbers themselves.
- Exam papers and attempts that carry a score into the markbook.
- Report cards and the approve → publish trail (who entered, who approved, when the parent may see it).
- Attendance register (present, late, absent) and the at-risk flag that is computed from marks + absence.
- Lesson-plan comments that name a class or a teacher evaluation score, if LIA classifies those as internal.

4.3 Care, conduct, and protection

- Safeguarding / child-protection cases — school server only. Not copied to the cloud. Not visible to parents, students, or classroom teachers.
- Counseling notes, IEP / special-needs files, college-guidance notes.
- Discipline and grievance files on the DoSA register.
- Student documents the school uploaded (passport copy, transfer letter) if LIA marks them sensitive.

4.4 Staff files LIA treats as sensitive

- HR records and payroll numbers, if the Academy does not want salary or tax files off campus.
- Role allocations still follow the parent proposal: a teacher does not open safeguarding even on the school server.

4.5 Cameras

CCTV footage stays on the NVR / cameras LIA already owns. The Admin CCTV desk is a window, not a second video archive in the cloud.

If the internet to the outside world fails for an hour. Homeroom can still take attendance and a teacher can still enter marks, because those writes land on the school server inside the campus network. Parents at home will wait until the corridor to the cloud is open again. That is the honest trade of a vault: the school keeps working; the home app waits.

5. What stays on the MaJo-Bridge cloud

The cloud is the part of the system that must meet the public internet — phones, the live site, updates, and support. It holds **services and non-sensitive or explicitly published copies**, not the school's master student file.

Cloud item	Why it is in the cloud	What it must not become
Web app and Android updates	Parents and teachers install from outside campus	A place that stores raw marks
School ID login routing	The sign-in page must be reachable from home	A directory of children's dates of birth
Published parent view	A parent at home needs a page that works on a phone	A copy of draft marks or unpublished report cards
Announcements LIA chooses to publish	Notices need to reach phones	A second SIS
Gallery items LIA approves for the cloud	Photos are large; LIA may keep originals on campus and publish a set	A dump of every student document
Live bus GPS (while the driver is sharing)	Maps need live internet	A permanent track of every child after the trip
Training manuals and go-live articles	Staff read them on any browser	Student data
System health (disk, uptime, errors)	MaJo support must see if the school cannot log in	Named student rows

LIA may tighten this list in the kickoff workshop. Example: "gallery stays on the school server only." That is a switch, not a rewrite. The rule does not change: **if it can harm a child when leaked, the master is on campus.**

6. How the two servers work together

6.1 The locked corridor

The school server and the cloud talk only over an encrypted link (HTTPS). The cloud cannot browse the vault like a shared folder. It may ask for a specific published page — "show this parent the report card the Section Director already approved" — and the school server answers yes or no.

6.2 One student id

Creating a child still happens once, on the SIS that lives on the school server. LMS, attendance, markbook, fees, bus list, and support all use that id — the same integration story as Section 9 of the parent proposal. Hybrid does not split the child into "cloud student" and "campus student."

6.3 Approve-and-publish still holds

A teacher enters a mark on the school server. Leadership approves on the school server. Only then may a limited published copy be visible to the linked parent through the cloud door. Draft marks never sit in the cloud waiting to leak.

6.4 Roles do not get weaker

Hybrid is not a shortcut around Section 8 of the parent proposal. A Grade 8 teacher still does not open safeguarding — whether she is on campus Wi-Fi or at home. A parent still sees only approved children. Another school on the same cloud still cannot open LIA.

6.5 What a morning looks like

- **On campus.** Homeroom opens the same attendance desk. The write lands on the LIA server. DoSA oversight reads the same register.
- **Marking.** Scores go into the on-campus markbook. The Section Director approves there. The parent app shows the mark only after publish.
- **At home.** The parent opens the same Android app or web door. The cloud checks the login, then asks the school server for the published page only.
- **Bus.** The driver shares GPS through the cloud map. The passenger list that names children is still an LIA-server list.

7. Security, backups, and who holds the keys

Question the Board will ask	Answer in this hybrid
Who owns the student data?	Lebawi International Academy. MaJo-Bridge operates the software. The school owns the records. That sentence from the parent proposal does not change.
Where is the master copy?	On the LIA school server for every collection listed in Section 4.
Can MaJo staff open a child's mark from the cloud console?	No. Support sees health and login issues. Opening a named student row on campus needs LIA's named officer and the school-server role — not a cloud browse.
What if the school server disk fails?	LIA IT writes the Friday snapshot from Go-live (parent proposal Sections 10 and 14). We add a second copy on a second disk or school PC that LIA controls. Platform-owner restore is a drill LIA schedules — it does not move the master into the public cloud.
What if someone steals a laptop?	The vault is the server, not the teacher's laptop. The laptop holds a session, not the whole SIS. MFA remains available for leadership and finance (parent proposal Section 10).
Encryption?	HTTPS on the corridor. Disk encryption on the school server. The hosted cloud encrypts what it is allowed to hold (sessions, published pages, health signals).
Audit?	Who changed a mark or opened a safeguarding file is logged on the school server. Leadership and QA open that log as in the parent proposal.

Consent, access requests, and erasure requests stay on the Go-live desk. If a parent asks to erase a file, staff process it on the school server — the place the file actually lives.

8. What LIA provides and what MaJo-Bridge provides

LIA provides	MaJo-Bridge provides
A locked room or cabinet, power, and (recommended) a simple backup power pack	The school-server software, the cloud software, and the encrypted corridor between them
A campus network so classrooms can reach the school server	Installation, hardening checklist, and the role map from the parent proposal
One IT / Administration Staff lead who can restart the machine and write the Friday snapshot	Training for that person, plus Mon-Sat support 09:00–18:00 EAT
A written list, at kickoff, of any extra collection LIA wants only on campus (for example gallery originals)	The switches that place those collections on the school server
Lawful parent consent, as in the parent proposal	The same five doors: administration, teacher, parent, student, driver — still one School ID

LIA does not need to hire a second software company for the vault. The 55+ desks stay the desks in the FINAL proposal. Only their **home address** changes for the sensitive ones.

9. How we implement hybrid for LIA

Phase	What happens
A. Confirm the split	Workshop with IT, Registrar, Section Directors, DoSA, QA. Tick Section 4 and Section 5. Write any extra “campus-only” items.
B. Place the school server	MaJo-Bridge installs the vault software on the LIA machine. LIA IT confirms lock, power, and classroom reach.
C. Open the corridor	Encrypted link to the MaJo-Bridge cloud. Login still uses School ID. A dry-run: enter a test mark on campus; confirm it is absent from the cloud master; publish; confirm the test parent sees only the published copy.
D. Cut over people	Same as parent proposal Phase 4–5: import students onto the school-server SIS, create staff, approve first parent links, first week of attendance and markbook.
E. Friday rhythm	Snapshot on the school server. Cloud health check for the corridor. Support line if the whole school cannot log in.

Phases 1–3 of the parent proposal (product, configuration of the 55+ desks, testing) remain complete. This addendum is the hosting cutover LIA asked for — not a new TOR and not a second academic system.

10. Company experience that continues from the parent proposal

The FINAL proposal introduced MaJo Bridge Technologies and Events as the designer and operator of MaJo Bridge e-School OS. This addendum continues that introduction with the work the same company already delivers — so LIA can see that hybrid hosting and new desks are not a first experiment.

10.1 Fenote Raey Academy

Fenote Raey Academy (ፍኖተ ራእይ አካዳሚ) is a school implementation of the same MaJo e-School Bridge family: administration, teachers, parents, students, and drivers on one School ID. That work is how we practise a full school operating system for a second academy — branding, roles, module mix — without writing a second product. LIA remains its own isolated tenant. Fenote Raey cannot open LIA records; LIA cannot open Fenote Raey records.

10.2 GYMOS — gym software

GYMOS is membership and gym-floor software: who belongs, who visited, who is allowed on the floor. It is a different industry from a school, and that is the point. The habit is the same as LIA's SIS: one record, roles, a live desk instead of a spreadsheet. When a gym asks for “member files on our machine, the app in the cloud,” that is the same hybrid sentence LIA is asking now.

10.3 Post Printing Company — ERP

For Post Printing Company we deliver an ERP-style operational system: orders, production, and the screens a print house actually uses. Printing is not education, but it is a business that also keeps customer jobs and files it does not want as a public-cloud master. That delivery is evidence we place ledgers on the machine the client controls, and keep the shared tools where they belong.

10.4 Tena — health and fitness app

Tena is a health and wellbeing / fitness app for people who train and track how they feel. It is a consumer product beside the school ERP. It shows the company can ship a phone app that people use every day — the same kind of door LIA parents will open — while keeping health-type facts under a clear rule.

10.5 Websites and other ongoing projects

MaJo-Bridge designs, builds, and maintains client websites — public pages and the back-office those sites need. Further builds are in delivery now. LIA is not the last item on a finished list. The company is actively shipping, which is why a hybrid cutover and a later new desk can be scheduled instead of promised as a future rewrite.

What this means for LIA. The FINAL proposal showed the academic system is already built. This addendum shows the company that built it also runs another school (Fenote Raey Academy), a gym product (GYMOS), a printing ERP (Post Printing Company), a health and fitness app (Tena), websites, and ongoing work. Hybrid hosting is therefore a configuration we stand behind with a team that already splits “what the client must hold” from “what the cloud may carry.”

11. Closing statement

Majo-Bridge Technology and Events PLC submits this Addendum A as a continuation of the LIA Technical Proposal FINAL (Version 1.0).

The 55+ desks stay as written. LIA's new hosting rule is also written: sensitive records live on the Academy's own server; other data and services live on the Majo-Bridge cloud; staff and parents still use one login. We are ready to place the vault, open the corridor, and walk IT and the first offices through the dry-run on the live product.
